Blur Background Apps Mac

When posting a lot of photos online there will be cases when you will want to blur certain parts of a photo in order to hide the identity of a certain person or create a cool looking depth of field effect. These are probably the most frequent scenarios when one might need to blur an image. As you can imagine, you will need a specialized app to do this. The first option that pops to mind would be Photoshop, but the problem with that tool is that it costs hundreds of dollars. And taking into account that you are probably not a professional graphics designer and you just need to occasionally blur some photos, then this kind of investment would not make sense. You probably just need an app that simply applies the blur effects that you want in a simple and straightforward way and does not require you to break the bank. Well, in that case, Photo Blur FX is probably the right app for you.

Google Meet to Get Background Blur, Captioning, and Low-Light Mode Monday June 29, 2020 2:59 AM PDT by Tim Hardwick Google Meet will soon allow users to add images or a blur effect to backgrounds. When setting up your video and audio before joining a Teams meeting, select background effects. Here you can choose to blur your background, select from a list of images, or upload your own image. What are the system requirements for background effects in Teams? Background effects are currently available for PC and Mac client applications. Its a good app for full photos with backgrounds, but for editors like myself, trying to blur an image with a png background doesn't work. I wanted to make one side of the PNG image blurry, but after i saved the image to my photos, the background to the image was pure black and the png background was removed.

The most common reason that you would need to blur a photo is to hide the identity of a person that does not want to appear in a picture that you want to post on your website or blog. Photo Blur FX does this in a very straightforward way. You just have to select the size of the circular area that will be blurred, the intensity of the blur effect and the position of the blurred circle. You can see the effects of your settings by looking at the image preview and when you are satisfied with the results just save your blurred photo and your are done. If you want to see how you can blur a person's face using Photo Blur FX, just watch the video below:

A more complicated blur effect that is used a lot these days is the focus blur or depth of field effect. Most of the low-end and mid-level digital cameras don't have the capability to take such photos directly, but that does not mean that you cannot apply the focus blur effect afterwards, on your desktop, using the right app. If you want to learn how to apply the depth of field effect to your photos using Photo Blur FX, just watch the video below:
