Remote desktop app for sharing screens and files sharing across most devices focusing. This video demonstrates how to set your Mac up to accept VNC connections. First we open up the 'system preferences'. Double click on Sharing and then go down to remote management and check this. We can see some options. Check the options Open and quit the application, Change settings, Delete and replace items, Send text messages, Restart and shutdown and Copy items. Then select 'OK'. Ultra VNC is a powerful, easy to use and free - remote pc access softwares - that can display the screen of another computer (via internet or network) on your own screen. The program allows you to use your mouse and keyboard to control the other PC remotely. It means that you can work on a remote computer, as if you were sitting in front of it, right from your current location.

#### Which program should you use?

Your computer may be trying to use the wrong program to open the VNC file, or it may not have a program installed that can open the file. There are a few different programs you can use to open VNC files, including Virtual PC Virtual Network Configuration File, TightVNC Configuration File, and Virtual Network Computing software. Try downloading one or more of these from the manufacturer's website to open your VNC file.

#### What type of file is it?

The file type is the key to opening VNC files. VNC files are usually considered Settings Files. You may already have a program on your computer that can open this type of file.

If the file type is unknown, you can find it in the file properties by following the steps below.

#### Windows:

1. Right-click the file and click "Properties".
2. Look under "Type of File" for the file type.

#### Mac:

1. Right-click the file and click "Properties".
2. Look under "Kind" for the file type.

#### Who developed the software?

If you can't find the right program to open your VNC file, a software developer might be able to help you. Contact the developer of one of the most common programs for VNC files from the list below.

Software	Developer
Virtual PC Virtual Network Configuration File	is developed by Microsoft Corporation
TightVNC Configuration File	is developed by TightVNC Development Team
Virtual Network Computing	is developed by Microsoft Developer
GibbsCAM CAD/CAM File	is developed by Gibbs and Associates Inc.

#### Why not try a universal file viewer?

A universal file viewer is a program that can open files with a wide range of extensions, depending on the file format. When you have VNC files you can't open, a universal file viewer like File Magic (Download) can open it for you. Just remember that some files aren't compatible with this type of program, and they will only open in binary format.

If you try opening an unsigned app by double-clicking it, it won't work. You'll see an "App Name can't be opened because it is from an unidentified developer" message. Of course, there may be a time when you come upon an unsigned app that you need to use. If you trust the developer, you can tell your Mac to open it anyway. Then navigate to /Library/vnc/vncagent and select the Open button: and then click the lock icon again. Instant Support App is downloaded from the internet. Starting with Mac OS 10.15 you must specifically allow Instant Support to be opened on install as it is downloaded from the internet. Select open to allow the application to run.
